Introduction

The leafhoppers or Cicadellidae (Homoptera: Auchenorrhyncha: Cicadoidea) have sucking mouthparts, three tarsal segments, forewings usually of uniform texture, antennae usually short and bristle-like, and the beak arises from the back of the head. The Cicadoidea contains five families: Cicadidae (cicadas), Membracidae (treehoppers), Cercopidae (spittlebugs), Aetalionidae (aetalionid treehoppers) and the Cicadellidae (leafhoppers). The Cicadellidae is the largest family of this group, and members have the following diagnostic characters: two ocelli or none, pronotum not extending over the abdomen, and hind tibia with one or more rows of spines. The family Cicadellidae is cosmopolitan in distribution, and members occur everywhere plants (their hosts) can survive.

Biology

Leafhoppers (Cicadellidae) are a large group of insects that are very important to Agriculture. Many species can be abundant and can cause considerable damage to crops by feeding directly on the plants or by being vectors of plant pathogens (Nielson 1968). Many species emit honeydew, much as aphids do, and other insects such as ants may tend individuals for this unusual source of food. Leafhoppers also are known to produce sound for intraspecific communication (Ossiannilsson 1949), although most sounds are quite weak and usually have to be amplified to be heard. These sounds probably are used by leafhoppers for species recognition and sexual selection. Some species have a broad range of food plants while others may be quite host specific. In temperate high latitudes they usually have a single generation per year, but in warmer climes species generally have multiple generations per year. Most species are sexual, but a few, typically from high elevations or high latitudes, appear to be parthenogenetic (Oman 1949).

Systematics

There are approximately 22000 species of leafhoppers described for the entire world (McKamey 2002). The fauna of the Neotropical Region is poorly known and although approximately 5000 species are described, there are easily 5000 to 10000 undescribed species in the region, and perhaps many more. There are 38 subfamilies in the family (Oman *et al.* 1990, with updates by Godoy & Webb 1994; Dietrich & Rakitov 2002) with 20 of these found in the Neotropical Region. Information on the subfamilies and genera of the world is found in Oman *et al.* 1990. The bibliography of the leafhopper literature up to 1955 can be found in the General Catalogue of the Homoptera, Fascicle VI (Metcalf 1962-1968), and from 1955 to 1985 in Oman *et al.* 1990. Here we give full citations only for those genera described after 1985.

Synopsis and species lists

Host plant or food plant data are unknown for most species, and because most of the species in the present list were collected with Malaise traps this type of data is not included in the tables. Interested readers are referred to two lists, one for the Brazilian fauna (Zanol & Menezes 1982) and another for the Nicaraguan fauna (Maes & Godoy 1993; Freytag & Maes 1997; and Maes *et al.*1999) which will give

[1] This study was supported by National Science Foundation Grant number DEB 0205982 given to the junior author.

host plant associations for many of the species. Synonyms are not presented in this list due to the magnitude of the information but these may be found in the references.

New material is deposited in the Instituto von Humboldt, Villa de Leyva, Colombia and representative specimens are held in the collection of the University of Kentucky, Lexington, Kentucky, USA.

Cicadelidos (Homoptera: Cicadellidae) de Colombia

Paul H. Freytag y Michael J. Sharkey

***Palabras Clave*:** *Cicadelidos, Cicadellidae, Colombia, lista de especies*

Introducción

Los Cicadelidos o Cicadellidae (Homoptera: Auchenorrhyncha: Cicadoidea) se caracterizan por poseer estructuras bucales para chupar, tres segmentos tarsales, alas anteriores con textura uniforme, antenas usualmente cortas y filamentosas, y el pico insertado en la base de cabeza. La superfamilia Cicadoidea contiene cinco familias: Cicadidae (Chicharras), Membracidae (Saltarines), Cercopidae (Loritos), Aetalionidae (Saltarines Aetalionidos) y Cicadellidae (Chicharritas). La familia Cicadellidae es la más grande dentro del grupo y sus miembros se distingue por tener dos o ningún ocelo, pronoto no extendido sobre el abdomen y tibia posterior con una o mas filas de espinas. Cicadellidae tiene una distribución cosmopolita y sus miembros están presentes en cualquier lugar donde haya plantas presentes (sus hospederos).

Biología

Los cicadelidos (Cicadellidae) son un gran grupo con especial importancia agrícola. Muchas especies pueden ser extremadamente abundantes y así mismo causar daños considerables en cultivos al alimentarse directamente de las plantas o al ser vectores de patógenos (Nielson 1968). Muchas especies secretan néctar, así como los afidos, y por lo tanto otros insectos tales como las hormigas pueden alimentarse de ellos. Los Cicadelidos emiten sonidos para comunicarse intraespecificamente (Ossiannilsson 1949), sin embargo la mayoría de estos sonidos son muy débiles y por lo tanto requieren ser amplificados para ser escuchados. Probablemente estos sonidos sean utilizados en reconocimiento de especies y selección sexual. Hay especies tanto generalistas como especialistas con respecto a las plantas hospederas. En zonas temperadas, los Cicadelidos usualmente tienen una sola generación al año pero en climas más cálidos tienden a tener varias generaciones por año. La mayoría de las especies se reproducen sexualmente, sin embargo algunas parecen reproducirse por partenogénesis (Oman 1949).

Sistemática

Aproximadamente 22000 especies de Cicadelidos han sido descritos en el mundo entero (McKamey 2002). La fauna del Neotrópico ha sido poco estudiada y aunque se han descrito unas 5000 especies, fácilmente pueden haber entre 10000 y 15000 sin describir. La familia comprende 38 subfamilias (Oman et al. *1990, con actualizaciones de Godoy & Webb 1994; Dietrich & Rakitov 2002) de las cuales 20 están presentes en la Región Neotropical. Información general acerca de las subfamilias y géneros del mundo se puede encontrar Oman* et al. *1990. La literatura hasta el año 1955 se puede encontrar en el catálogo general de Homoptera, Fascículo VI (Metcalf 1962-1968), y desde 1955 hasta 1985 en Oman* et al. *1990. En el presente trabajo solo citamos bibliografía para aquellos géneros descritos después de 1985.*

Sinopsis y lista de especies

Las plantas hospederas son desconocidas para la mayoría de las especies de Cicadelidos, y en cuanto a que la mayoría de especies aquí incluidas fueron colectadas con trampas Malaise, no incluimos este tipo de datos en las tablas. Los lectores interesados en el tema pueden revisar dos listas, una de la fauna brasilera (Zanol & Menezes 1982) y otra de la fauna nicaragüense (Maes & Godoy 1993; Freytag & Maes 1997; y Maes et al.*1999), las cuales tienen información de plantas hospederas para muchas de las especies aquí incluidas.*

No incluimos las sinonimias debido a la magnitud de la información, sin embargo estas pueden ser encontradas en algunas de las citas bibliográficas.

El material nuevo fue depositado en la colección entomológica del Instituto Alexander von Humboldt, Villa de Leyva, Colombia, y aquellos especímenes representativos fueron depositados en la colección de la Universidad de Kentucky, Lexington, Kentucky, USA.

Box 1. Synopsis of Neotropical Cicadellidae

The numbers following each subfamily and tribe are the numbers of genera and species known or estimated to occur in the Neotropical Region followed by the number, in parenthesis, of the number known from Colombia. For each genus the number of species known or estimated for the Neotropical Region, followed by, in parenthesis, the number known from Colombia, based on the present research.

Cuadro 1. Sinopsis de Cicadellidae de Neotropical

Los números enfrente de cada subfamilia y tribu corresponden al número de géneros y especies conocidos o estimados para la Región Neotropical, y está seguido (entre paréntesis) por el número conocido para Colombia. Para cada género se incluye el número conocido o estimado de especies, seguido (entre paréntesis) por el número conocido para Colombia basado en el presente trabajo.

Taxonomic List / *Listado Taxonómico*

This table contains a list of the 678 species of leafhoppers known to us to occur in Colombia. The geographic distribution is given for each species both in the Neotropical Region and within the various regions of Colombia. Some of the older records list "Bogotá" as the locality and this may, or may not, be where the species was collected. We list some genera and subgenera that we expect to be found in Colombia because they are found in surrounding countries. We list genera and subgenera that have undescribed species from Colombia that we have seen.

Esta tabla contiene una lista de 678 especies de Cicadelidos reportados para Colombia. Se incluye la distribución geográfica para la Región Neotropical y las diferentes regiones dentro de Colombia. Algunos registros antiguos señalan a "Bogotá" como la localidad de colección, pero estos datos pueden o no ser ciertos. Incluimos algunos géneros y subgéneros que no han sido reportados en Colombia pero se espera que estén en el país por estar presentes en países vecinos. Igualmente incluimos géneros y subgéneros que contienen especies no descritas pero que nosotros hemos colectado en Colombia.
